[Experimental Phenomenon](#)

Feature Description

In this section, we will learn how to play the birthday song by programming with MicroPython.

Experimental Steps

Before flashing, make sure `LASTBIT.hex` has been flashed; otherwise, an error will occur and the module cannot be imported.

1. Before flashing, switch the switch to the OFF position and connect the computer to the microbit main board using a microUSB cable. **Note: it should be the Microbit interface, not the expansion board's Charging port.**
2. Open the Mu software. Here you can directly copy the program source code we provide; the operation steps are as follows. You can also enter the code yourself in the editor window. Note! All English characters and symbols should be entered in English input mode. Use the Tab key for indentation, and end the last line with a blank line.

Click the `New` button in the toolbar at the top left, and a file titled untitled will appear.

3. Copy the content of the `Code Implementation` section provided below into the current file. You will notice a small red dot after the title bar, indicating that the code content has been modified but is not yet saved.

Whether or not you save does not affect the code check and flashing.

4. At this point, you can click `Check` to check whether the code format has any problems.

5. If you have connected the MICROBIT to the PC in advance following the steps above and have flashed `LASTBIT.hex`, the next step is to download the current program to the Microbit.

Click the `Flash` tool in the toolbar to start flashing!

During flashing, the orange-yellow indicator light near the Microbit main board will blink frequently, and the editor will show `Copied code onto micro:bit.` at the bottom, indicating that the flashing is complete. After flashing, the indicator light will no longer blink.

6. Switch the switch to the ON position.

Code Implementation

```
# 3. Play birthday song
# Import the microbit and music module
from microbit import *
import music

# Display music note icon
display.show(Image.MUSIC_QUAVER)

# Play the birthday song
music.play(music.BIRTHDAY, wait=True)
```

`display.show`: used to control the images displayed on the micro:bit 5x5 LED matrix.

`Image.MUSIC_QUAVER` means displaying the music note icon.

`music.play`: used to play audio. The first parameter is the audio to be played, and the second parameter indicates whether it is blocking playback. The `loop` parameter is used to control whether to loop the playback; it defaults to `False`, and if changed to `True`, the audio will be played in a loop.

Experimental Phenomenon

The car will display the music note icon on the LED matrix, and the buzzer will play the birthday song.
